Sub: ROOF TOP SAFE WALK LADDERS.

Roof Top Safe Walk System is a safety device which we have procured for maintenance work on this Railway. We have found that this system is very useful.

It is a true life saver as it is more useful for safe working on fragile A.C. Sheet roof, which cannot resist the impact load of the working staff over the roof and this system distributes the load evenly to, appropriate members of roof.

This system is light in weight and hence can be used and moved conveniently without any complication, over the large roof and it is economical too.

With the safety that this system provides, workers get more confidence while working on the roof top and thus get encouraged, to do better quality work & thus the efficiency of the work increases.

Once this system is introduced, it proves that the time consumption is reduced substantially. There will be absolutely a care free working with this system and due to which the workmanship increases and in turn the out-turn increases.

This system will have no maintenance cost of recurring expenditure.

This ladder can work safely even during monsoon.

The method of operation is very simple and not difficult to understand by even an illiterate worker.

This system has an Indian Patent under No.147751.

It is therefore felt that each IOW must have these ladders for prevention of un-necessary accidents & increasing the efficiency.

Under the provision of Factories Act, 1948 and amended in 1986, it is mandatory to make use of safety device and the responsibility lies with the Occupier and the Manager even in the case of job allotted through a contract system.
